

Backup and disaster recovery solution for your business

How important is your data to your business?

Live Backup is a backup and disaster recovery solution that protects your servers and the data on them. It combines the speed and reliability of disk based backup with the added security of an encrypted offsite backup.

A backup device and standby server all in one box

With our live backup service your servers are backed up to a supplied network storage server (NAS), as often as every 15 minutes. Multiple versions are stored allowing you to restore all your data from a point in time.

Virtualization technology allows us to use the NAS device as a standby server within an hour of your server failing, keeping your downtime to a minimum.

What would your business do if you lost your backup?

Live backup includes an encrypted off-site backup of your data at two separate datacentres. So even if your NAS device fails, is destroyed or stolen your data will be secure.

In the event of such a disaster a replacement NAS, complete with the off-site copy of your data, will be with you within two working days. The NAS can then act as temporary server whilst you source new hardware.

Managed service

Your protected server and the NAS device will be managed and monitored by us to ensure the backups are taking place, and both systems are running smoothly.

Give us a call on 01279 813076 and put your data in safe hands.

Key Features

- A complete solution reducing downtime to an absolute minimum.
- Allows you to backup with data that is only fifteen minutes old.
- Affordable monthly payments
- Data is encrypted so only a passkey holder can access the data on the NAS or remote storage facility.
- Minimum contract of one year
